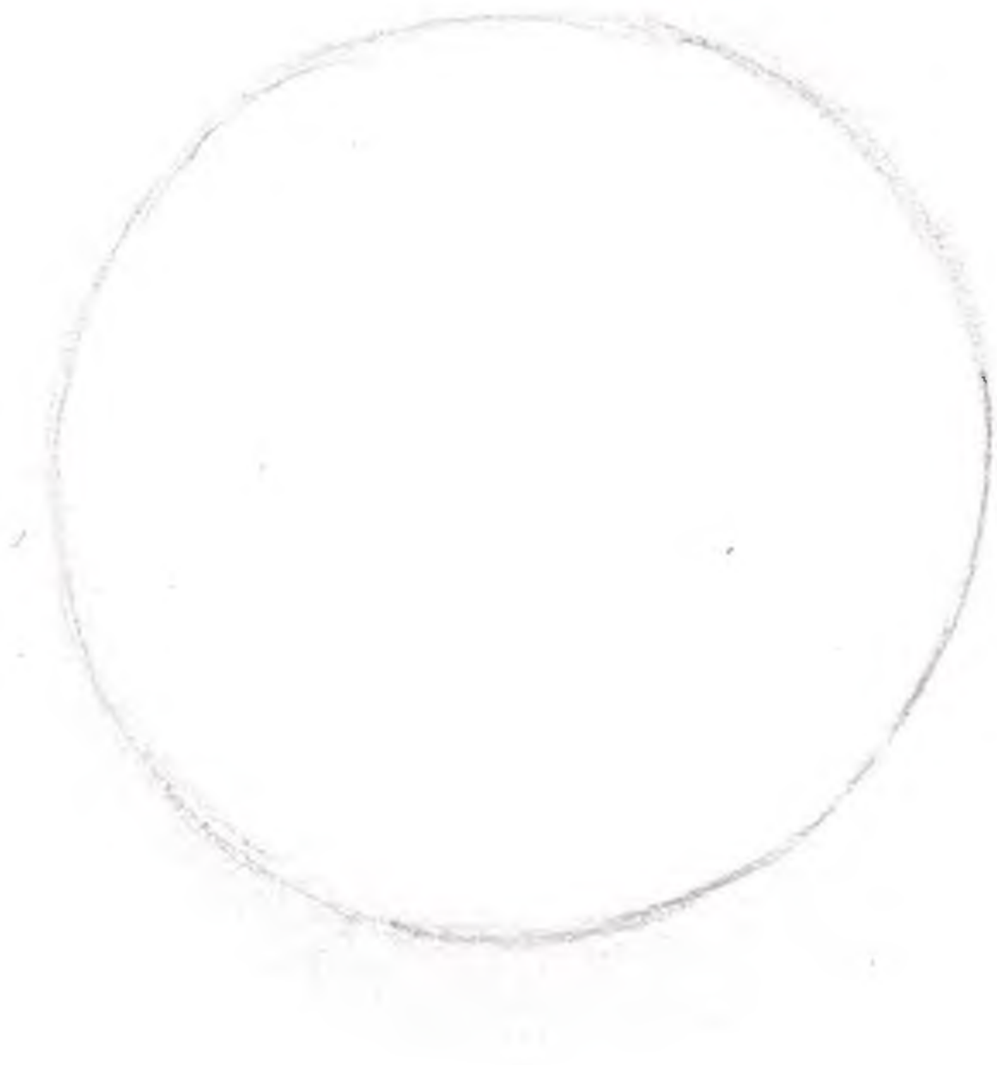
Algae, and beyond.

by Earth Floor.

"That makes plants grow! Now, the tree over there is older than your Grandparents! They saw it when they were your age."

"Wow!"

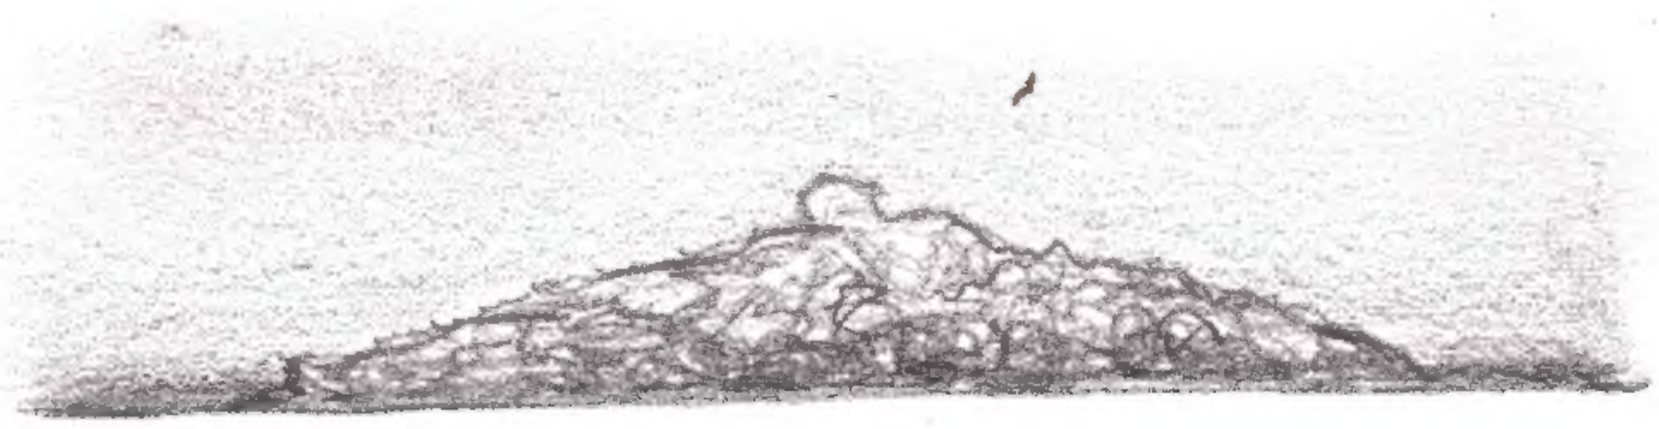
"That is how we know plants were born first, but the problem was they can not easily move. So we eat them, go to a new place, fast, and then they can grow! Then we can eat them from the new place, and go further."



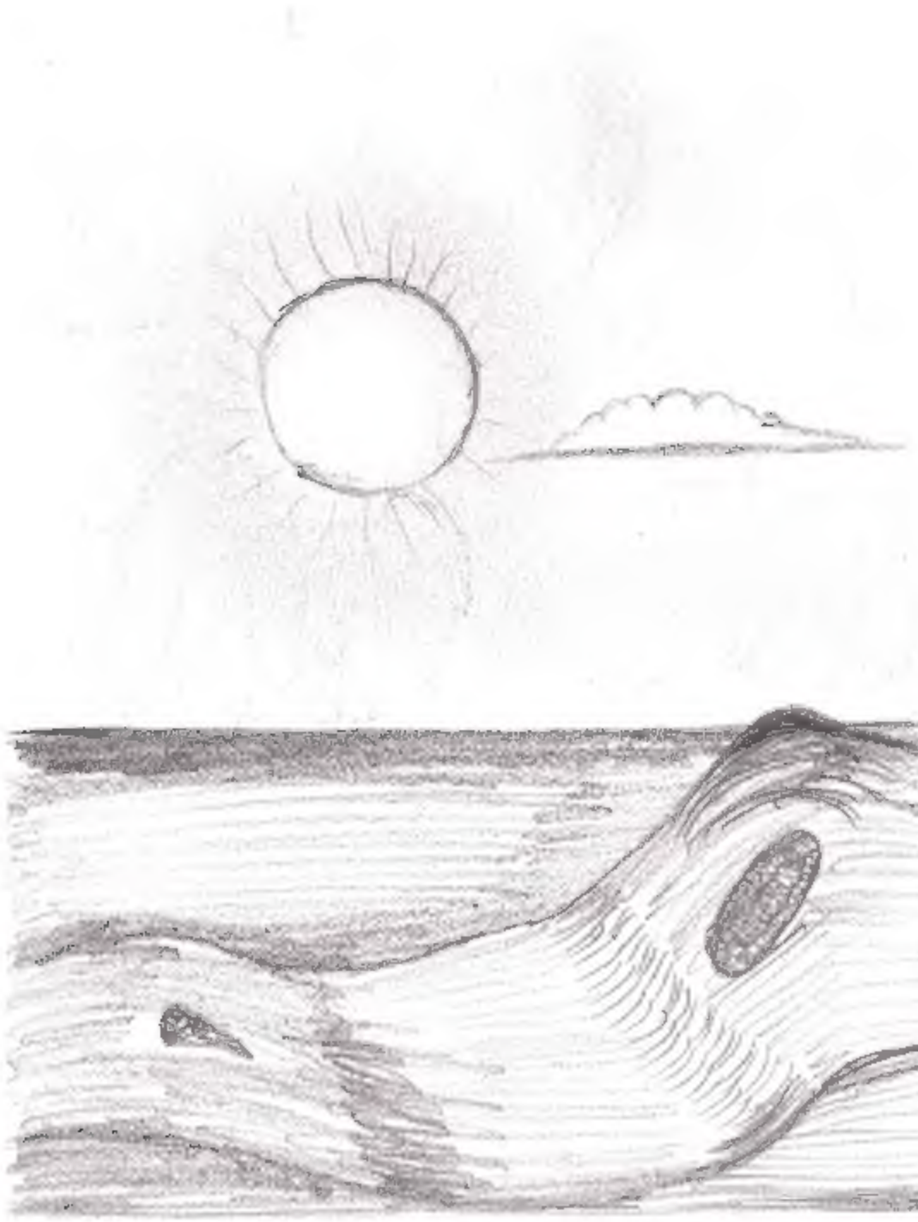
“How did they come?”

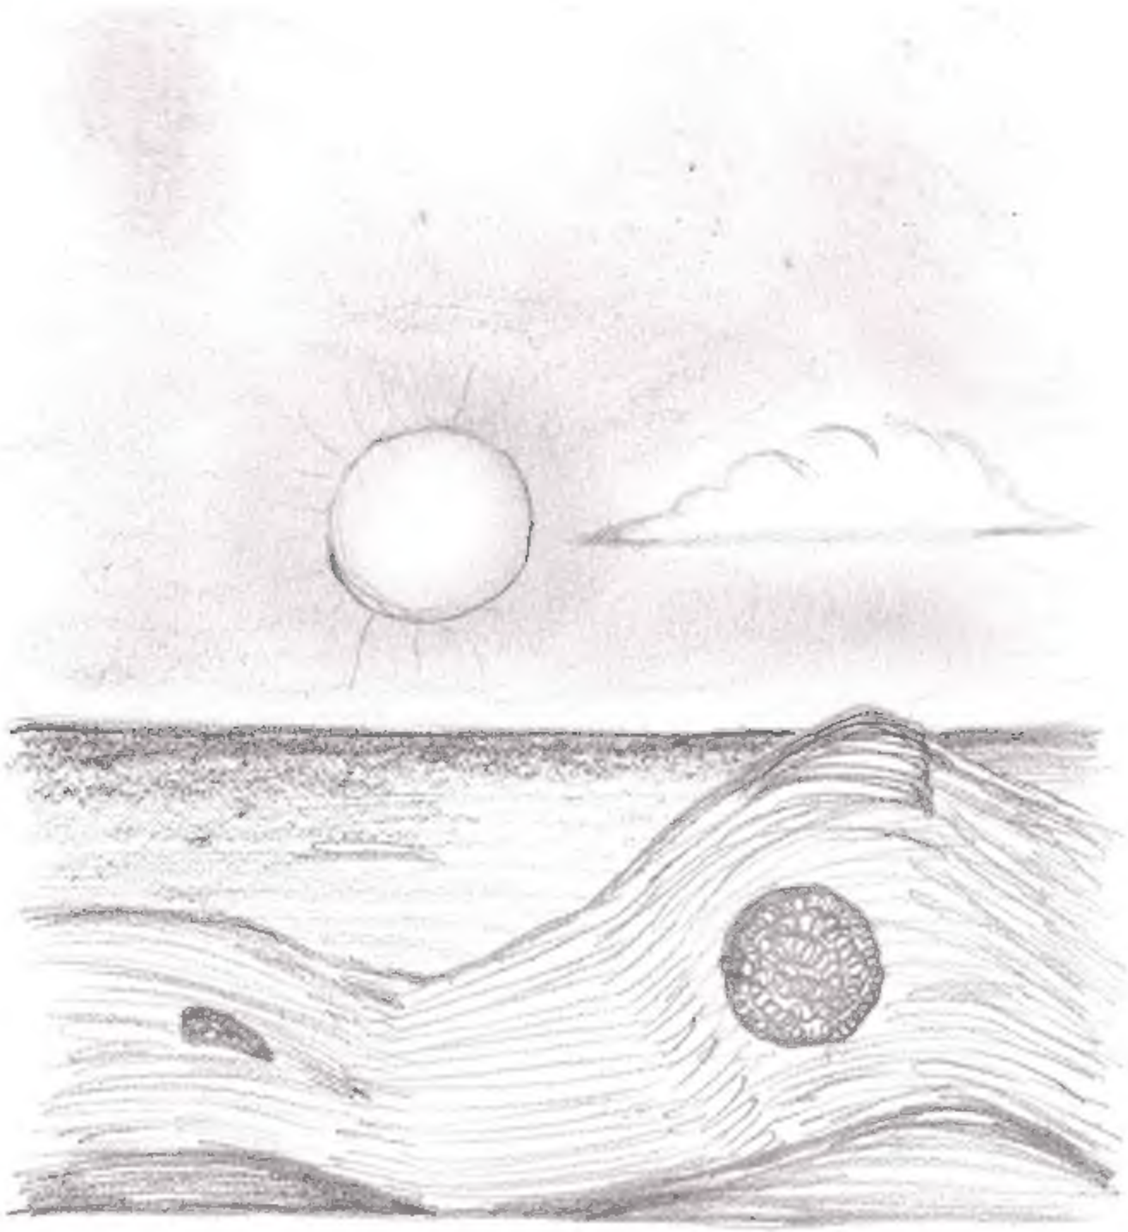
“The earth was rocky water, and then ‘Zap!’ the Sun fire blasted a lightning bolt to the ocean, and algae was born.

It turned empty water into warm life that can remember yesterday. Looking out, the life saw space, time, the moon, sun, star, and everything else that we have not yet been to. So, it made shapes that inspected each other.”



“First a line, then two, then triangle, square, and then it made an arrow camera to watch a circle patch ride a wave. But it was oblong! So it stretched to look like a circle to the other patch.”

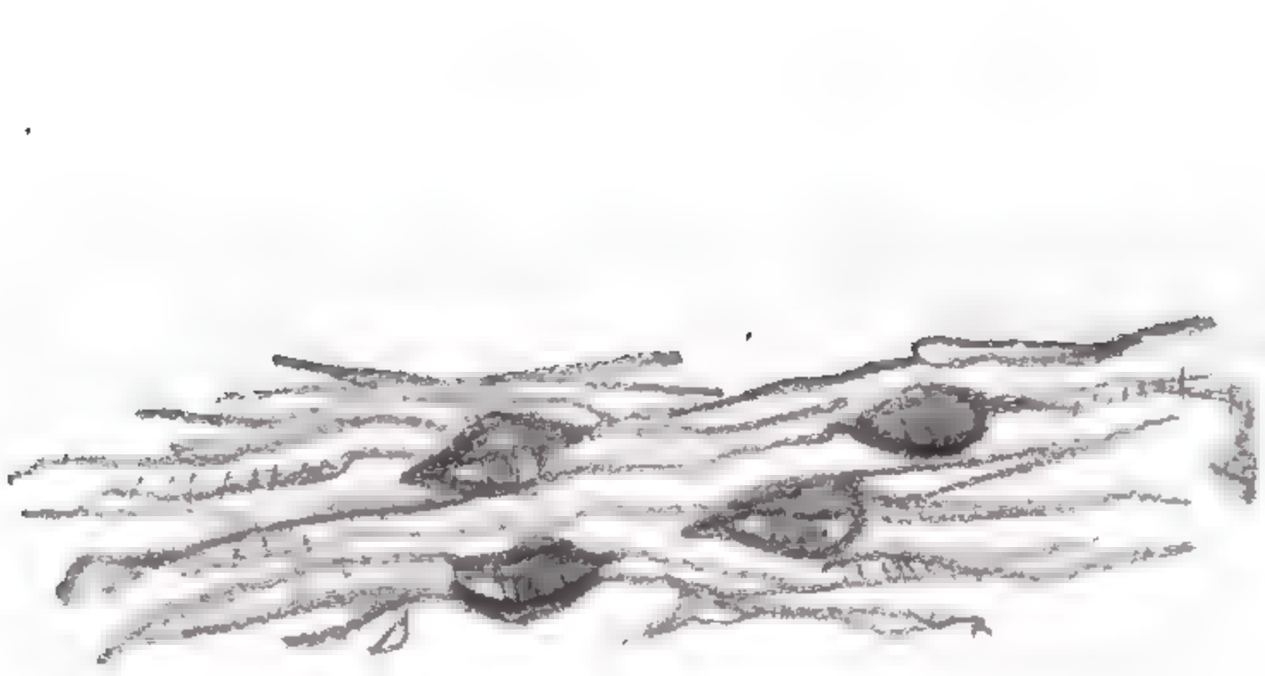




“Then, Sun rays passed and they measured all the stars. One day, it firmed and became seaweed, to explain the rays! And one grew purses, and collided with another. It taught the other seaweed that the Sun was just one purse out of many, the stars were each Suns!”

“So they make shapes to talk?”

“Yes! And when they came onto the land, they continued to guess about the sky.”

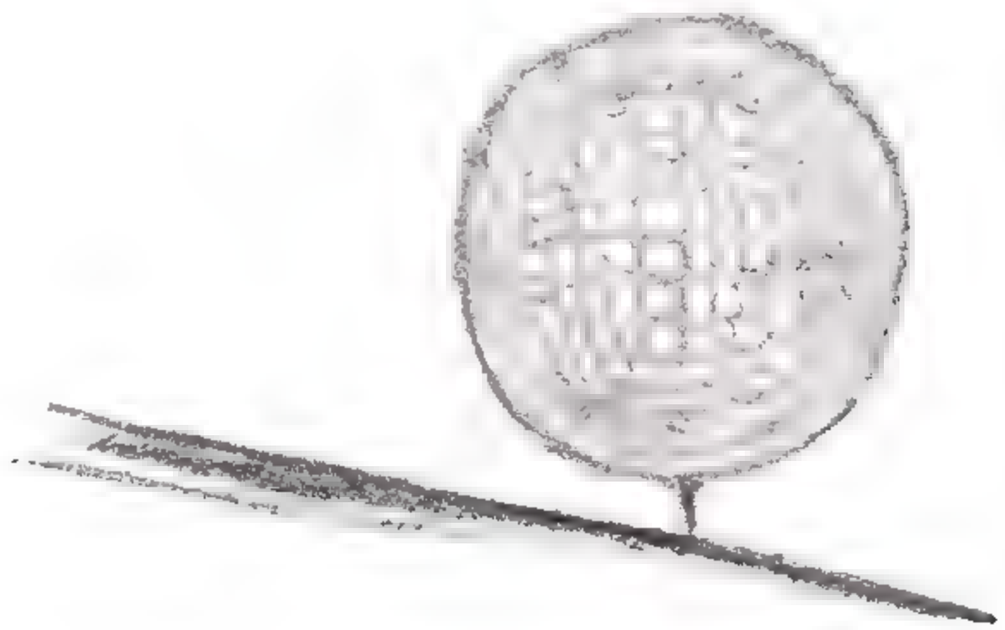


“The first was the mushroom. It guessed that behind the Sun circle was a stem, that we can not see. 'Maybe the Sun vacuums warmth,' it thought. But the measurement was not enough, so they kept changing!”

"Each plant came up with their own answer, about the Moon, Sun, Stars, Sky, Light, and Time."

"What do you think the berry bush guessed?"

“How about the Orange?”



“Or Bananas?”

“We have the most complete answer to the Universe, with all the plants supporting what we know. But, you can walk anywhere, and look back to what the plants thought.

Sometimes, they are still right!”

2026.
